

Inspiring Excellence

Course Title: Programming Language II

Course Code: CSE 111

Lab Assignment no: 3

Question 1

Suppose your little sibling wants your help to check his math homework. He is done with his homework but wants you to see if all his results are correct. Since the student with all correct results gets 3 stars. However, you want your brother to check this on his own. So, you design a calculator for him in python. You could have given your scientific calculator but you wanted to give him a basic calculator and also wanted to see if you can even design one.

Subtasks:

1. Create a class called Calculator.
2. Your class shall have 1 constructor and 4 methods, namely add, subtract, multiply and divide.
3. Now, create an object of your class. After creating an object, it should print "Let's Calculate!"
4. Then take 3 inputs from the user: first value, operator, second value
5. Now based on the given operator, call the required method and print the result.

Sample Input:

1
+
2

Sample Output:

Let's Calculate!
Value 1: 1
Operator: +
Value 2: 2
Result: 3

Question 2

Implement the design of the Course class so that the following output is produced:

Driver Code	Output
<pre># Write your code here c1 = Course("CSE110", "TBA", 8) c1.detail() print("=====") c2 = Course("CSE111", "TBA", 9) c2.detail()</pre>	<pre>CSE110 - TBA - 8 ===== CSE111 - TBA - 9</pre>

Question 3

Implement the design of the Patient class so that the following output is produced:

[For BMI, the formula is $BMI = weight/height^2$, where weight is in kg and height in meters]

Driver Code	Output
<pre># Write your code here p1 = Patient("A", 55, 63.0, 158.0) p1.printDetails() print("=====") p2 = Patient("B", 53, 61.0, 149.0) p2.printDetails()</pre>	<pre>Name: A Age: 55 Weight: 63.0 kg Height: 158.0 cm BMI: 25.236340330075304 ===== Name: B Age: 53 Weight: 61.0 kg Height: 149.0 cm BMI: 27.476239809017613</pre>

Question 4

Design a “**Vehicle**” class. A vehicle assumes that the whole world is a 2-dimensional graph paper. It maintains its x and y coordinates (both are integers). Any new object created of the Vehicle class will always start at the coordinates (0,0).

It must have methods to move up, down, left, right and a print_position() method for printing the current coordinate.

Note: All moves are 1 step. That means a single call to any move method changes the value of either x or y or both by 1.

[You are not allowed to change the code below]

<i># Write your class here</i>	<i>OUTPUT</i>
<pre>car = Vehicle() car.print_position() car.moveUp() car.print_position() car.moveLeft() car.print_position() car.moveDown() car.print_position() car.moveRight()</pre>	<pre>(0,0) (0,1) (-1,1) (-1,0)</pre>

Question 5

Design a class Shape for the given code below.

- Write a class Shape.
- Write the required constructor that takes 3 parameters and initialize the instance variables accordingly.
- Write a method area() that prints the area.

Hint: the area method can calculate only for the shapes: Triangle, Rectangle, Rhombus, and Square. So, you have to use conditions inside this method

For this task, assume that --

- for a triangle, the arguments passed are the base and height
- for a rhombus, the arguments passed are the diagonals
- for a square or rectangle, the arguments passed are the sides.

Driver Code	Output
<pre># Write your code here triangle = Shape("Triangle",10,25) triangle.area() print("=====") square = Shape("Square",10,10) square.area() print("=====") rhombus = Shape("Rhombus",18,25) rhombus.area() print("=====") rectangle = Shape("Rectangle",15,30) rectangle.area() print("=====") trapezium = Shape("Trapezium",15,30) trapezium.area()</pre>	<pre>Area: 125.0 ===== Area: 100 ===== Area: 225.0 ===== Area: 450 ===== Area: Shape unknown</pre>

Question 6

Implement the design of the **Calculator** class so that the following output is produced:

Driver Code	Output
<pre># Write your code here c1 = Calculator() print("=====") val = c1.calculate(10, 20, '+') print("Returned value:", val) c1.showCalculation() print("=====") val = c1.calculate(val, 10, '-') print("Returned value:", val) c1.showCalculation() print("=====") val = c1.calculate(val, 5, '*') print("Returned value:", val) c1.showCalculation() print("=====") val = c1.calculate(val, 16, '/') print("Returned value:", val) c1.showCalculation()</pre>	<pre>Calculator is ready! ===== Returned value: 30 10 + 20 = 30 ===== Returned value: 20 30 - 10 = 20 ===== Returned value: 100 20 * 5 = 100 ===== Returned value: 6.25 100 / 16 = 6.25</pre>

Question 7

Implement the design of the **Student** class so that the following output is produced:

Assume the credit for each course to be 3. For example: [3.3,4] can be calculated as:

$$\text{CGPA} = ((3.3 * 3) + (4 * 3)) / 6$$

[Here, for each course, the grade point is multiplied by 3. Total credit is the number of courses multiplied by 3. Since the example has 2 courses, therefore a total of 6 credits]

$$\text{CGPA} = \text{sum of individual (grade point * credit)} / \text{total credit}$$

Academic Standing Rule: [CGPA>3.80 Highest Distinction, CGPA>3.65 High Distinction, CGPA>3.50 Distinction, CGPA>2.00 Satisfactory, CGPA<2.00 Can't Graduate]

Driver Code	Output
# Write your code here s1 = Student('Dora', '15995599','CSE', [4,3.7,3.7,4]) s1.calculate_CGPA() print("===== s1.print_details() print("===== s2 = Student('Pingu', '12312322', 'EEE', [1.7,1.3,1.3,1.3,1]) s2.calculate_CGPA() print("===== s2.print_details() print("===== s3 = Student('Bob', '13311331', 'CSE', [2,3,3,3.7,2.7,2.7]) s3.calculate_CGPA() print("===== s3.print_details()	 ===== Name: Dora, ID: 15995599 Department: CSE CGPA: 3.85 Your academic standing is 'Highest Distinction' ===== ===== Name: Pingu, ID: 12312322 Department: CSE CGPA: 1.32 Sorry, you cannot graduate ===== ===== Name: Bob, ID: 13311331 Department: CSE CGPA: 2.85 Your academic standing is 'Satisfactory'

Question 8

Implement the design of the Account class so that the following output is produced:

Driver Code	Output
<pre># Write your code here a1 = Account() print(a1.details()) print("-----") a1.name = "Oliver" a1.balance = 10000.0 print(a1.details()) print("-----") a2 = Account("Liam") print(a2.details()) print("-----") a3 = Account("Noah",400) print(a3.details()) print("-----") a1.withdraw(6930) print("-----") a2.withdraw(600) print("-----") a1.withdraw(6929)</pre>	<pre>Default Account 0.0 ----- Oliver 10000.0 ----- Liam 0.0 ----- Noah 400.0 ----- Sorry, Withdraw unsuccessful! The account balance after deducting withdraw amount is equal to or less than minimum. ----- Sorry, Withdraw unsuccessful! The account balance after deducting withdraw amount is equal to or less than minimum. ----- Withdraw successful! New balance is: 3071.0</pre>

Question 10

Design the **Programmer** class such a way so that the following code provides the expected output.

Hint:

- Write the constructor with appropriate printing and multiple arguments.
- Write the addExp() method with appropriate printing and argument.
- Write the prinDetails() method

[You are not allowed to change the code below]

Write your code here.

```
p1 = Programmer("Ethen Hunt", "Java", 10)
p1.printDetails()
print('-----')
p2 = Programmer("James Bond", "C++", 7)
p2.printDetails()
print('-----')
p3 = Programmer("Jon Snow", "Python", 4)
p3.printDetails()
p3.addExp(5)
p3.printDetails()
```

OUTPUT:

```
Horray! A new programmer is born
Name: Ethen Hunt
Language: Java
Experience: 10 years.
-----
```

```
Horray! A new programmer is born
Name: James Bond
Language: C++
Experience: 7 years.
-----
```

```
Horray! A new programmer is born
Name: Jon Snow
Language: Python
Experience: 4 years.
Updating experience of Jon Snow
Name: Jon Snow
Language: Python
Experience: 9 years.
```

Question 11

Implement the design of the UberEats class so that the following output is produced:

[For simplicity, you can assume that a customer will always order exact 2 items]

Driver Code	Output
<pre># Write your code here order1 = UberEats("Shakib", "01719658xxx", "Mohakhali") print("=====") order1.add_items("Burger", "Coca Cola", 220, 50) print("=====") print(order1.print_order_detail()) print("=====") order2 = UberEats ("Siam", "01719659xxx", "Uttara") print("=====") order2.add_items("Pineapple", "Dairy Milk", 80, 70) print("=====") print(order2.print_order_detail())</pre>	<pre>Shakib, welcome to UberEats! ===== ===== User details: Name: Shakib, Phone: 01719658xxx, Address: Mohakhali Orders: {'Burger': 220, 'Coca Cola': 50} Total Paid Amount: 270 ===== Siam, welcome to UberEats! ===== ===== User details: Name: Siam, Phone: 01719659xxx, Address: Uttara Orders: {'Pineapple': 80, 'Dairy Milk': 70} Total Paid Amount: 150</pre>

Question 12

Implement the design of the Spotify class so that the following output is produced:

Driver Code	Output
<pre># Write your code here user1 = Spotify(["See You Again", "Uptown Funk", "Hello"]) print("=====") print(user1.playing_number(4)) user1.add_to_playlist("Dusk Till Dawn") print(user1.playing_number(3)) print(user1.playing_number(4))</pre>	<pre>Welcome to Spotify! ===== 4 number song not found. Your playlist has 3 songs only. ##### Playing 3 number song for you Song name: Hello ##### Playing 4 number song for you Song name: Dusk Till Dawn</pre>

Question 13

1	<code>class Test:</code>
2	<code> def __init__(self):</code>
3	<code> self.sum = 0</code>
4	<code> self.y = 0</code>
5	
6	<code> def methodA(self):</code>
7	<code> x=0</code>
8	<code> y =0</code>
9	<code> y = y + 7</code>
10	<code> x = y + 11</code>
11	<code> self.sum = x + y</code>
12	<code> print(x , y, self.sum)</code>
13	
14	<code> def methodB(self):</code>
15	<code> x = 0</code>
16	<code> self.y = self.y + 11</code>
17	<code> x = x + 33 + self.y</code>
18	<code> self.sum = self.sum + x + self.y</code>
19	<code> print(x , self.y, self.sum)</code>

Write the output of the following code: t1 = Test() t1.methodA() t1.methodA() t1.methodB() t1.methodB()	x	y	sum

Question 14

1	<code>class Scope:</code>
2	<code> def __init__(self):</code>
3	<code> self.x, self.y = 1, 100</code>
4	<code> def met1(self):</code>
5	<code> x = 3</code>
6	<code> x = self.x + 1</code>
7	<code> self.y = self.y + self.x + 1</code>
8	<code> x = self.y + self.met2(x + self.y) + self.y</code>
9	<code> print(x, self.y)</code>
10	<code> def met2(self):</code>
11	<code> y = 0</code>
12	<code> print(self.x, y)</code>
13	<code> self.x = self.x + y</code>
14	<code> self.y = self.y + 200</code>
15	<code> return self.x + y</code>

Write the output of the following code: q2 = Scope() q2.met1() q2.met2() q2.met1() q2.met2()	x	y

Question 15

1	<code>class Test3:</code>
2	<code> def __init__(self):</code>
3	<code> self.sum, self.y = 0, 0</code>
4	<code> def methodA(self):</code>
5	<code> x, y = 2, 3</code>
6	<code> msg = [0]</code>
7	<code> msg[0] = 3</code>
8	<code> y = self.y + msg[0]</code>
9	<code> self.methodB(msg, msg[0])</code>
10	<code> x = self.y + msg[0]</code>
11	<code> self.sum = x + y + msg[0]</code>
12	<code> print(x, y, self.sum)</code>
13	<code> def methodB(self, mg2, mg1):</code>
14	<code> x = 0</code>
15	<code> self.y = self.y + mg2[0]</code>
16	<code> x = x + 33 + mg1</code>
17	<code> self.sum = self.sum + x + self.y</code>
18	<code> mg2[0] = self.y + mg1</code>
19	<code> mg1 = mg1 + x + 2</code>
20	<code> print(x, self.y, self.sum)</code>

<p>Write the output of the following code:</p> <pre>t3 = Test3() t3.methodA() t3.methodA() t3.methodA() t3.methodA()</pre>	x	y	sum

Question 16

1	<code>class Test5:</code>
2	<code> def __init__(self):</code>
3	<code> self.sum, self.y = 0, 0</code>
4	<code> def methodA(self):</code>
5	<code> x = 0</code>
6	<code> z = 0</code>
7	<code> while (z < 5):</code>
8	<code> self.y = self.y + self.sum</code>
9	<code> x = self.y + 1</code>
10	<code> print(x, self.y, self.sum)</code>
11	<code> self.sum = self.sum + self.methodB(x, self.y)</code>
12	<code> z += 1</code>
13	<code> def methodB(self, m, n):</code>
14	<code> x = 0</code>
15	<code> sum = 0</code>
16	<code> self.y = self.y + m</code>
17	<code> x = n - 4</code>
18	<code> sum = sum + self.y</code>
19	<code> print(x, self.y, sum)</code>

Write the output of the following code: t5 = Test5() t5.methodA()	x	y	sum
